

GLOBAL SUPERSTORE SALES & PROFIT ANALYSIS

Tableau Business Intelligence & Data Analytics Report

Project	Global Superstore Sales & Profit Analysis
Business Domain	Retail / E-commerce
Tool	Microsoft Power BI
Dataset	Global Superstore
Analysis	Revenue, Profit, Products, Regions, Channels and Profitability
Prepared By	Aashish Kapadia

1. Executive Summary

This project presents a Global Superstore Sales & Profit Analysis solution developed in Microsoft Power BI. The objective is to evaluate revenue, profitability, product economics, geographic performance, sales channels and profit-margin behavior, and convert the dashboard into practical business recommendations.

The supplied dashboard shows a strong positive relationship between revenue and profit across markets. Europe and Sub-Saharan Africa are the largest displayed contributors, while Asia and Central America and the Caribbean form the next tier. Household and Office Supplies are among the largest sales contributors, while Cosmetics and Household are among the strongest absolute profit contributors.

The dashboard also shows a distinction between absolute profit and profit margin. Clothes has the highest displayed profit margin at approximately 67.20%, followed by Cereal at about 43.07% and Vegetables at about 40.98%. Online and offline channels move in broadly similar directions over time.

2. Business Problem

Management needs a clear view of where revenue and profit are generated, which products create the strongest economic value, which markets require attention, and whether channel or margin trends indicate business risks.

- Measure revenue, profit, units sold and profitability at market and product level.
- Identify high-performing and high-margin item types.
- Compare online and offline sales-channel performance.
- Identify geographic markets with strong or weak profitability.
- Monitor profit-margin stability and investigate periods of deterioration.
- Translate dashboard findings into actionable commercial recommendations.

3. Dataset & Methodology

The analysis uses the Global Superstore dashboard visuals supplied for this project. The dashboard combines order-date, item-type, market/region, sales-channel and profitability information and applies descriptive and diagnostic analytics through KPI-style comparisons, bar charts, stacked area charts, treemaps, maps and trend views.

Area	Examples
Time	Order Date / Year
Products	Item Type
Geography	Region, Country, Market Area
Channels	Online, Offline
Measures	Total Revenue, Total Profit, Units Sold, Profit %, Profit Margin

4. Key Performance Indicators

KPI	Dashboard Value	Interpretation
Total Revenue	≈ \$118.9B*	Approximate total based on displayed regional revenue.
Total Profit	≈ \$34.5B*	Approximate total based on displayed regional profit.
Units Sold	≈ 40M+ per item type	Most item types cluster around the low-40-million range.

Top Profit-Margin Item	Clothes — 67.20%	Highest displayed item-type profit margin.
Strongest Displayed Markets	Sub-Saharan Africa / Europe	Largest displayed revenue and profit points.
Margin Benchmark	≈ 29.5%	Displayed trend benchmark around the high-20% range.

*Approximate visual estimates; validate against the underlying Power BI model before publication.

5. Dashboard Analysis

5.1 Executive / Revenue & Profit View

The revenue-versus-profit visual shows a strong positive relationship: markets with greater revenue also tend to produce greater absolute profit. Sub-Saharan Africa and Europe sit at the top of the displayed comparison, while North America is substantially smaller.

Key interpretation: revenue scale is an important driver of absolute profit, but margin efficiency must also be evaluated.

Figure 1. Supplied Global Superstore dashboard visual.

Figure 2. Supplied Global Superstore dashboard visual.

5.2 Product Analysis

Household and Office Supplies lead the displayed combined sales view, while Cosmetics, Household and Office Supplies are among the strongest absolute profit contributors. The profit-margin treemap highlights Clothes at approximately 67.20%, Cereal at 43.07%, Vegetables at 40.98%, Cosmetics at 39.77% and Baby Food at 37.55%.

Key interpretation: portfolio decisions should consider both absolute profit and margin percentage.

Figure 3. Supplied product / profitability visual.

5.3 Sales Channel Analysis

Online and offline revenue trends move in broadly similar directions over time. Both channels contribute materially across the displayed years, and both show a pronounced decline in the final displayed year.

Key interpretation: optimize channel strategy by region and product. Validate the final-year decline for seasonality, incomplete-period coverage or a genuine change in demand.

5.4 Regional & Geographic Analysis

The geographic views show strong profitability across many markets, while selected countries display negative or comparatively weak profit percentages. Examples visible in the dashboard include Japan, Maldives, Mauritius, Panama and South Africa on the weaker side, while New Zealand and Tonga show positive but more modest percentages.

Management implication: use country-level profitability to identify pricing, distribution, discount, shipping or product-mix interventions.

Figure 4. Supplied geographic profitability visual.

5.5 Profitability & Margin Analysis

The profit-margin trend fluctuates around the high-20% to low-30% range, with periodic peaks above 30% and dips below the displayed benchmark. The overall pattern is relatively stable but contains short-term volatility.

Key interpretation: connect margin dips with product mix, channel mix, market mix and discounting in the underlying model.

6. Category / Item-Type Analysis

Item Type/Group	Displayed Signal	Business Interpretation
Household	Very high sales; strong absolute profit	Protect availability and pricing while monitoring margin.
Office Supplies	Very high sales; strong absolute profit	Important scale category with material profit contribution.
Cosmetics	High absolute profit; $\approx 39.77\%$ margin	Strong profitability candidate for focused growth.
Clothes	$\approx 67.20\%$ margin	Highest displayed margin; test scalable growth without erosion.
Cereal	$\approx 43.07\%$ margin	High-margin category with growth potential.
Vegetables	$\approx 40.98\%$ margin	Strong displayed margin; evaluate volume and market expansion.

The central category insight is that revenue share, absolute profit and profit margin are different measures. A high-margin item type may have a smaller revenue base, while a high-revenue item type may produce a lower margin.

7. Regional Analysis

Region	Approx. Revenue	Approx. Profit	Observation
Sub-Saharan Africa	$\approx \$35.8\text{B}$	$\approx \$10.3\text{B}$	Largest displayed revenue/profit contributor.
Europe	$\approx \$34.9\text{B}$	$\approx \$10.2\text{B}$	Very strong scale and profitability.
Asia	$\approx \$19.2\text{B}$	$\approx \$5.7\text{B}$	Strong second-tier market.
Central America & Caribbean	$\approx \$14.7\text{B}$	$\approx \$4.3\text{B}$	Material contribution with growth potential.
Australia & Oceania	$\approx \$11.1\text{B}$	$\approx \$3.2\text{B}$	Solid mid-tier contributor.
North America	$\approx \$3.2\text{B}$	$\approx \$0.9\text{B}$	Smallest displayed regional contribution.

Sub-Saharan Africa and Europe are the strongest displayed markets by revenue and absolute profit. Lower-scale markets should be assessed for demand, pricing, distribution and product-mix constraints before expansion decisions.

8. Customer / Market Analysis

The supplied Global Superstore visuals are primarily market-, product- and channel-oriented rather than customer-segment-oriented. For portfolio reporting, the customer/market layer is therefore interpreted as market-area contribution and country profitability.

- Use revenue and profit together when ranking markets.
- Separate high-scale markets from high-margin markets.
- Investigate negative-profit countries before increasing promotional spend.
- Build a market scorecard using revenue, profit, margin and year-over-year growth.

9. Discount & Profitability Analysis

The supplied Global Superstore visuals do not provide a direct discount-versus-profit chart. Therefore, no causal discount conclusion is asserted. A strong next analytical step is to connect discount levels with item type, market, channel and profit margin in the underlying model.

Recommended diagnostic: test whether higher discounts are concentrated in lower-margin products or weaker markets, and measure incremental revenue against the associated change in profit.

10. Key Business Findings

- Europe and Sub-Saharan Africa are the strongest displayed regions by revenue and absolute profit.
- Household and Office Supplies are among the largest sales contributors.
- Cosmetics, Household and Office Supplies are among the strongest absolute profit contributors.
- Clothes has the highest displayed profit margin at approximately 67.20%.
- Cereal and Vegetables also show high displayed margins at approximately 43.07% and 40.98%.
- Online and offline channels show broadly similar movements over time.
- The displayed final-year decline should be validated before being treated as a structural business decline.
- Several countries show weak or negative displayed profit percentages and warrant market-level investigation.
- Revenue scale and margin efficiency should be evaluated separately when making growth decisions.

11. Business Recommendations

1. Protect high-profit categories: maintain availability, competitive pricing and inventory discipline for Cosmetics, Household and Office Supplies.
2. Scale high-margin categories carefully: test whether Clothes can grow volume while preserving its strong margin.
3. Build a country profitability scorecard: rank markets by revenue, profit, margin and growth to identify expansion and turnaround priorities.
4. Optimize channel strategy: identify which products and regions over-index online versus offline and tailor promotions accordingly.
5. Investigate margin volatility: connect monthly margin changes with product mix, channel mix, discounts and market mix.
6. Validate the final-year decline: confirm whether it reflects incomplete data, seasonality or genuine demand deterioration.
7. Separate high profit from high margin: use both measures when deciding where to invest.

12. Technical Skills Demonstrated

- Power BI dashboard development
- DAX KPI and measure design
- Power Query/data preparation
- Sales and profitability analysis
- Product and market segmentation
- Regional and geographic analysis
- Interactive slicers and filtering
- Trend, stacked-area and scatter-plot analysis
- Geographic visualization

- Business storytelling and recommendations

13. Limitations & Validation

- The report is based on the supplied dashboard screenshots; the underlying Power BI model and DAX measures were not independently audited.
- Revenue and profit totals in this report are approximate visual estimates because the screenshots show rounded axis labels rather than exact totals.
- Some map labels are dense or truncated, limiting detailed country-level interpretation.
- The final-year decline should be validated against complete source data before strategic use.
- The supplied visuals do not show a direct discount-versus-profit diagnostic, so discount causality is not claimed.
- Observed relationships are descriptive and do not establish causality.

14. Conclusion

The Global Superstore Sales & Profit Analysis project is a strong end-to-end Business Intelligence portfolio example. It combines revenue and profit comparison, product profitability, geographic analysis, sales-channel trends, margin analysis and actionable business recommendations.

The strongest business message is that scale and profitability are related but not identical. Europe and Sub-Saharan Africa are major contributors, while Clothes demonstrates the highest displayed margin. Product, market and channel decisions should therefore be evaluated using revenue, absolute profit and margin together.

15. Portfolio Project Summary

Portfolio Element	Recommended Text
Project Title	Global Superstore Sales & Profitability Dashboard – Regional, Product & Channel Analysis
Tools	Power BI, DAX, Power Query
Domain	Retail / E-commerce
Objective	Identify revenue and profitability drivers across products, markets and sales channels.
Key Finding	Europe and Sub-Saharan Africa lead scale; product margins vary substantially by item type.
Business Value	Supports pricing, product, market, channel and profitability decisions.

Appendix – Suggested KPI / DAX Definitions

Metric	Conceptual Definition
Total Revenue	SUM(Sales / Revenue field)
Total Profit	SUM(Profit)
Units Sold	SUM(Units Sold / Quantity field)
Profit Margin	DIVIDE([Total Profit], [Total Revenue])
Profit % by Item Type	DIVIDE([Item Type Profit], [Item Type Revenue])
